Nipple Lift℠

What is Nipple Lift℠? What conditions may be treated?

Nipple Lift℠ uses fillers such as Juvaderm to enlarge and lift the aging nipple tissues. The more youthful protruding shape is quickly restored. Topical medicine can also be used to improve the coloration of the youthful nipple. Nipple Lift nicely complements breast enhancement surgery for the saggy or shrunken breast due to pregnancies and aging.

The procedure takes less than fifteen minutes. Procedure usually requires only local anesthetics.

When and What Results Might Be Expected? How long does the results last?

Immediate improvement of nipple over three to six months is expected.

What is the recovery like? When can I return to work and activities?

Recovery usually is none. Mild swelling is expected. Use of prescribed pain medicine is not necessary. Most patients return to work and regular activities either immediately.

Any treatments to help maintain or enhance my results?

Minor adjustments, maintenance, or further enhancements can often be done non-surgically with further sessions of the procedure. More extensive or permanent changes require surgical shaping.
