

Non-Surgical Breast Lift: Breast Thermage™

What is Non-Surgical Breast Lift: Breast Thermage™? What conditions may be treated?

Breast Thermage™ uses radio frequency to tighten the early saggy skin of the upper breast tissue by using electrical energy to produce collagen remodeling, growth, and fat shrinkage in select areas. Correctable conditions include early stages of saggy breast.

The procedure takes one hour. Procedure usually requires oral and/or inhalation sedation.

When and What Results Might Be Expected? How long does the results last?

Gradual and conservative improvement of breast position over three to six months is expected to last up to one year.

What is the recovery like? When can I return to work and activities?

Recovery usually is none. Mild swelling is expected. Use of prescribed pain medicine is not necessary. Most patients return to work and regular activities either immediately.

Any treatments to help maintain or enhance my results?

Minor adjustments, maintenance, or further enhancements can often be done non-surgically with further sessions of the procedure. More extensive or permanent changes require surgical shaping.
