

NON-SURGICAL EYES: EyeLiftSM

What is EyeLiftSM (non-surgical eyes)? What conditions may be treated?

EyeLiftSM is a synergistic combination treatments of **Thermage**, **BOTOX®**, and filler injections to the eyelid areas to restore the youthful gaze of the eyes. Correctable conditions include saggy eyebrows, crow's feet, skin laxity, sunken eyes, and lower eye bags.

No incision is necessary and simultaneous **Thermage**, **BOTOX®**, and synthetic fillers are given in one stage. Touch-up by residual fillers in subsequent sessions may be required for final results.

What is the recovery like? When can I return to work and activities?

Recovery usually takes one weekend. Minimal swelling and bruising are expected. Use of prescribed pain medicine is not necessary. Make-up can be applied immediately. Most patients return to work and regular activities either immediately or within one weekend.

When and What Results Might Be Expected? How long does the results last?

Immediate dramatic improvement of sunken or hollow areas is expected, followed by gradual dramatic improvement of crow's feet in one week, followed by more gradual conservative eyebrow elevation and skin laxity in three months.

Results generally last up to one year with further treatments suggested for maintenance.

Any treatments to help maintain or enhance my results?

Minor adjustments, maintenance, or further enhancements can often be done non-surgically with further sessions of the procedure. More extensive or permanent changes require surgical shaping.
